

Reaction Plane and Flow Measurements at BRAHMS

In Copenhagen FLOW looked promising with the current
BRAHMS multiplicity arrangement....

...now that we meet in Krakow, our optimism is
somewhat tempered.

But only slightly.

BRAHMS Reaction Plane and Flow

1

Basics

Ref.: A.M Poskanzer and S.A. Voloshin,
Phys. Rev. C 58, 1671((1998)

$$\frac{dN}{d(\phi - \Psi_R)} = N_0 \left(1 + 2V_1 \cos(\phi - \Psi_R) + 2V_2 \cos(2(\phi - \Psi_R)) + \dots \right)$$

6/10/03

BRAHMS Reaction Plane and Flow

2

Event Plane Reconstruction:

$$\Psi_n = \tan^{-1}(X_n/Y_n)/n$$

$$(X_n, Y_n) = (\Psi_n w \cos(n\Psi_n), \Psi_n w \sin(n\Psi_n))$$

Data Used in Analysis for Copenhagen Meeting

First 61 sequences of run 2336 (130 GeV Au+Au)
 20-40% Centrality
 $-29 \text{ cm} \leq Z_{\text{vertex}} \leq -9 \text{ cm}$ (center vertex at Si ring)

BRAHMS Reaction Plane and Flow

3

Event Plane Resolution (Qualitative)

Procedure:

Evaluate 2 (or more) “sub-event” planes. For no flow the correlation between two random planes of the same order should be a triangular distribution. Folding ϕ_a ϕ_b about $\pi/2$ should give flat distribution

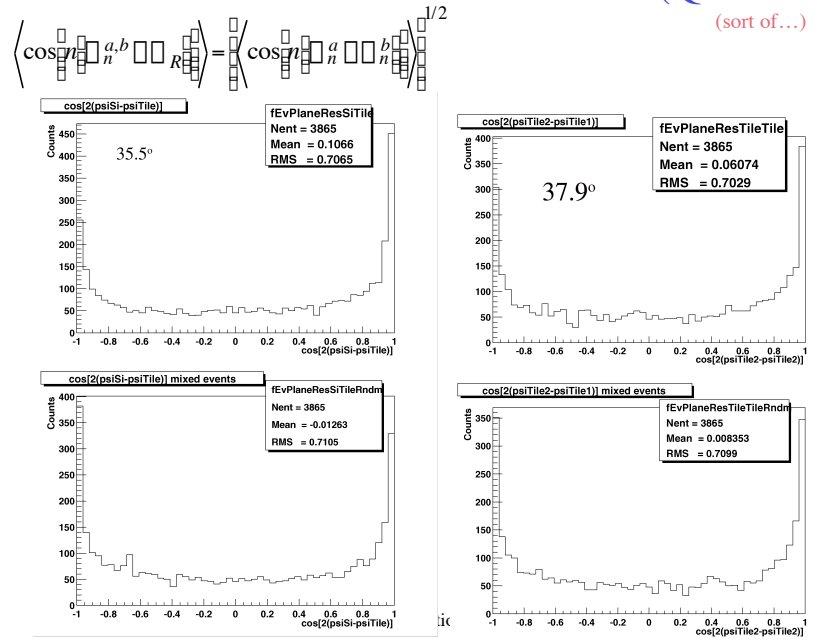

6/10/03

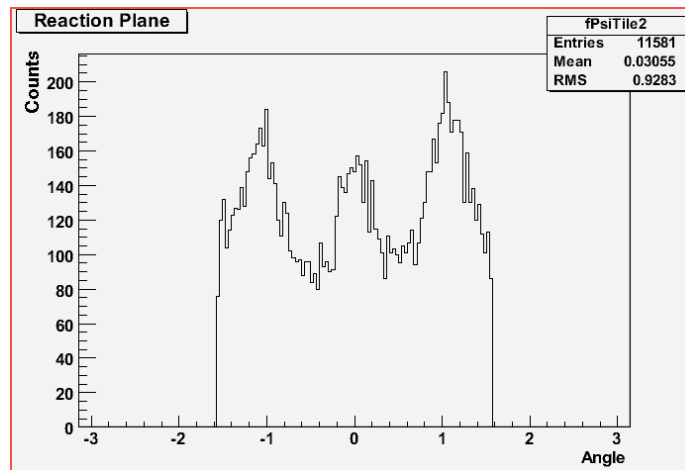

4

Event Plane Resolution (Quantitative)

(sort of...)

Problem found with closer inspection...

..this should be flat!!!

Characterization in terms of “anomalous” energy deposition...

Data:
