

## $dN/d\eta$ for d+Au (with much credit going to Hiro)

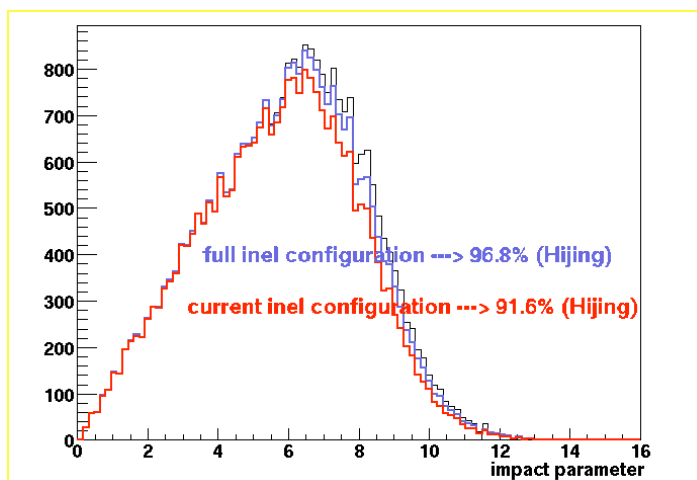

What can we achieve?...

What have we achieved?...

6/10/03

d+Au multiplicity

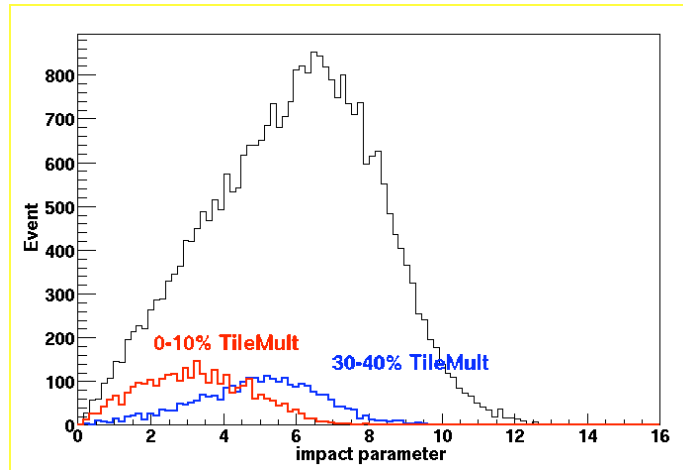

The inelasticity counters give a pretty good min-bias trigger...

6/10/03

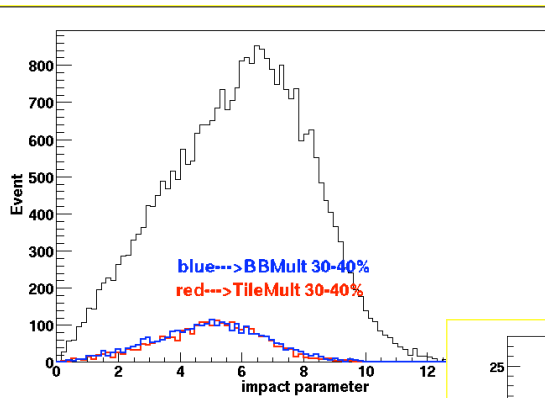

d+Au multiplicity

A cut on Tile multiplicity will only roughly select an impact parameter range...

6/10/03

d+Au multiplicity

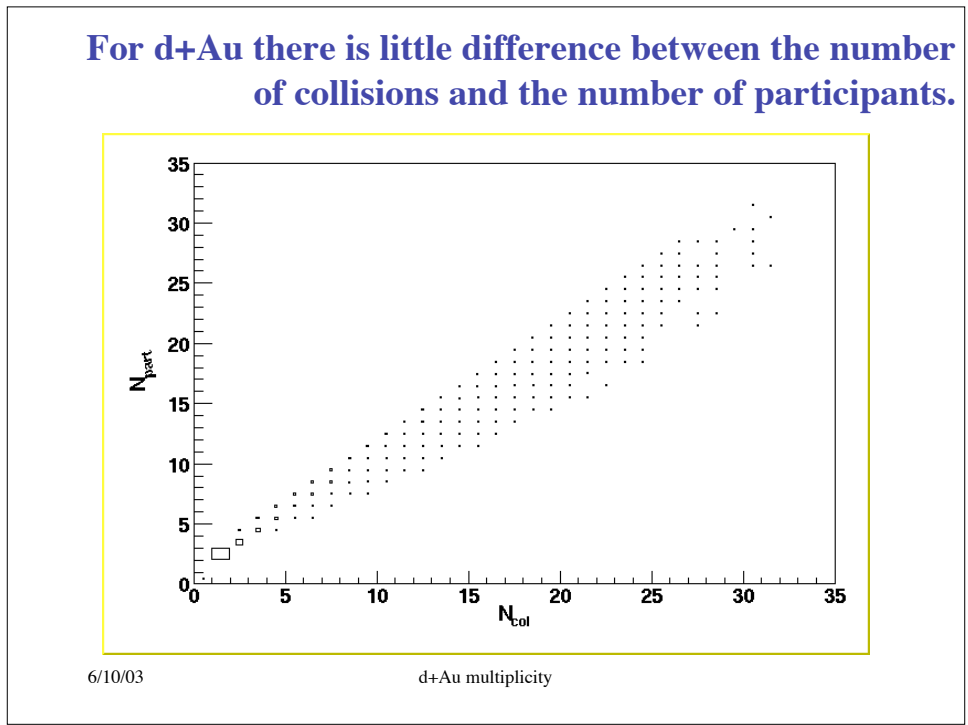

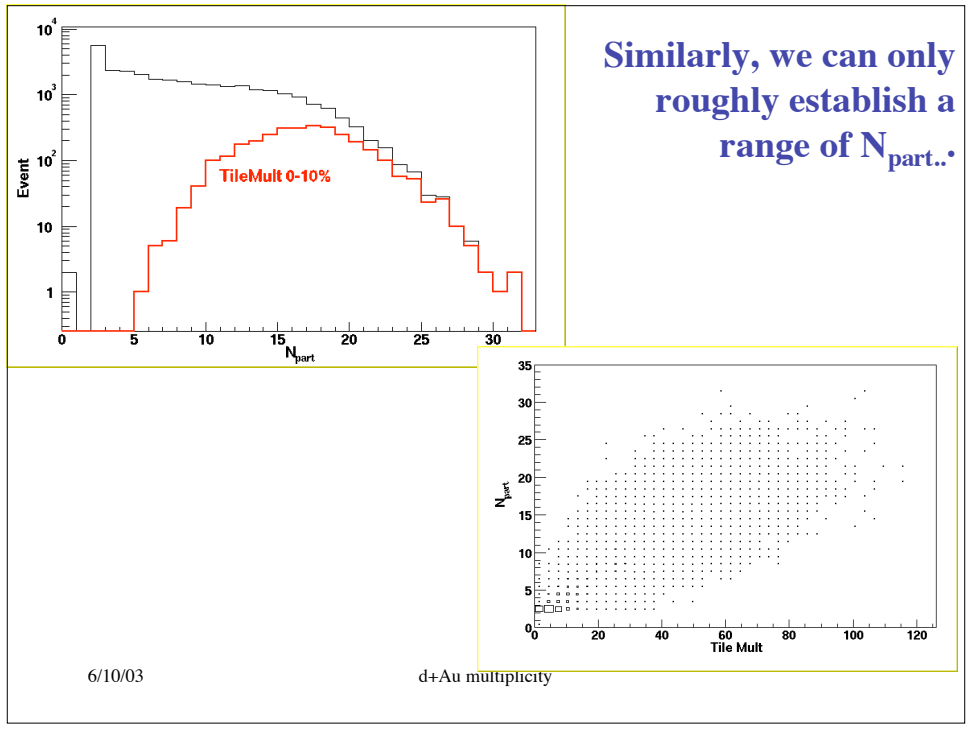

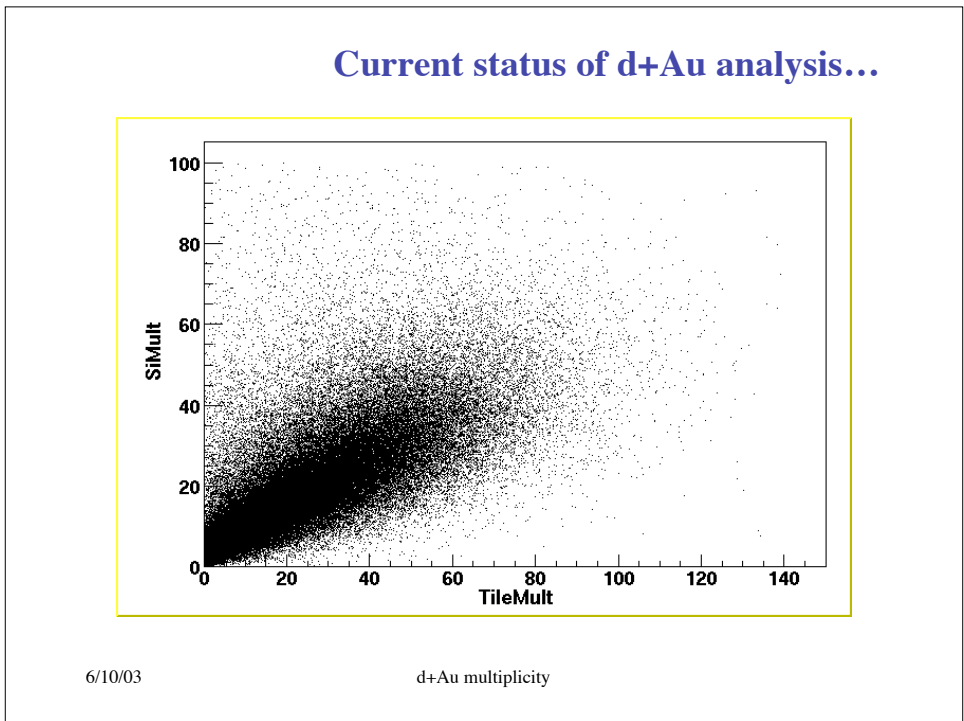

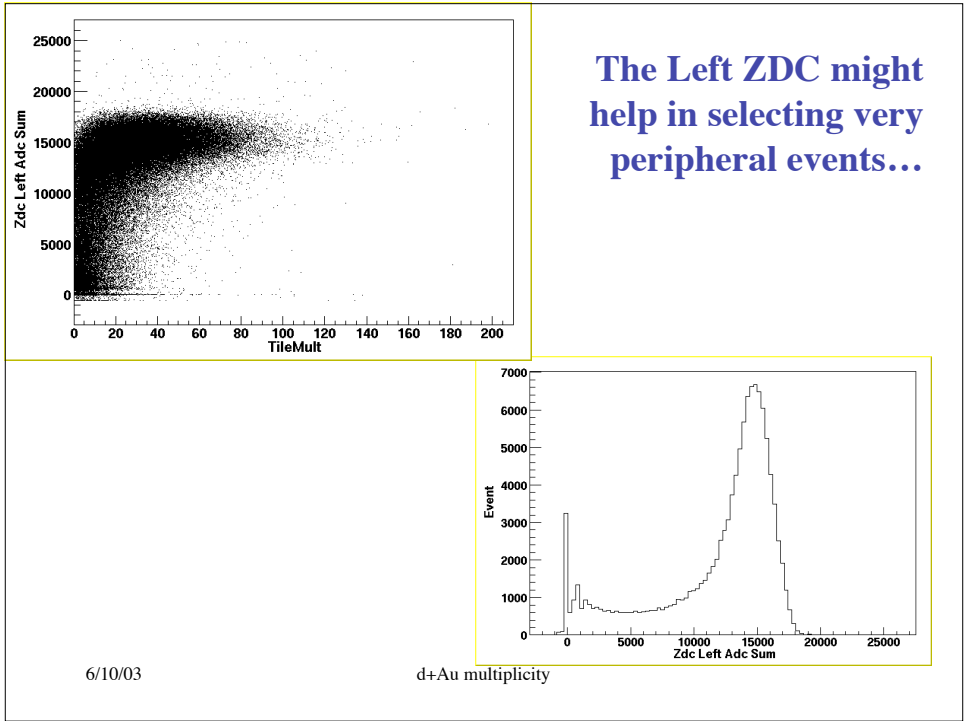

This is also the case if we use the BB (left) multiplicity...

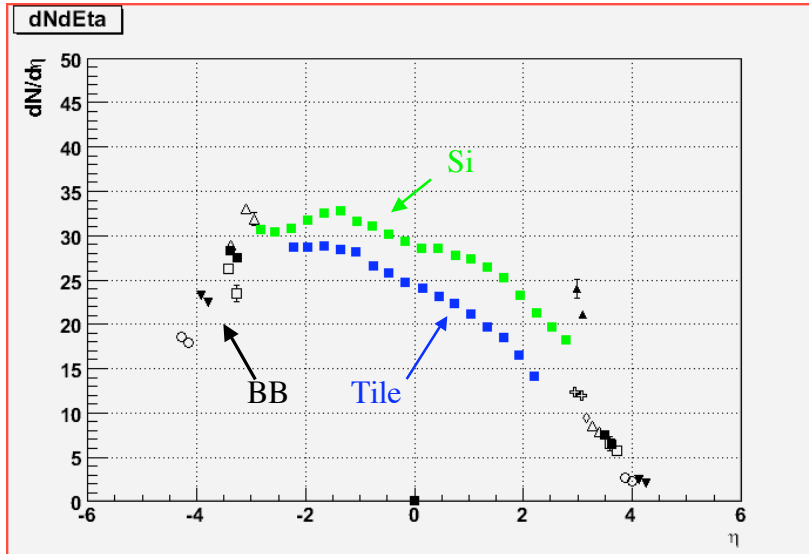

6/10/03

d+Au multiplicity

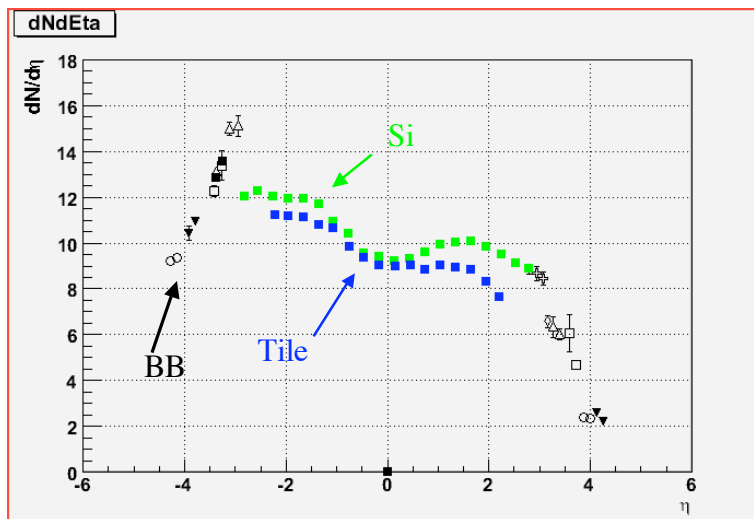

$dN/d\eta$  (0-10% central)

6/10/03

d+Au multiplicity

$dN/d\eta$  (40-50% central)

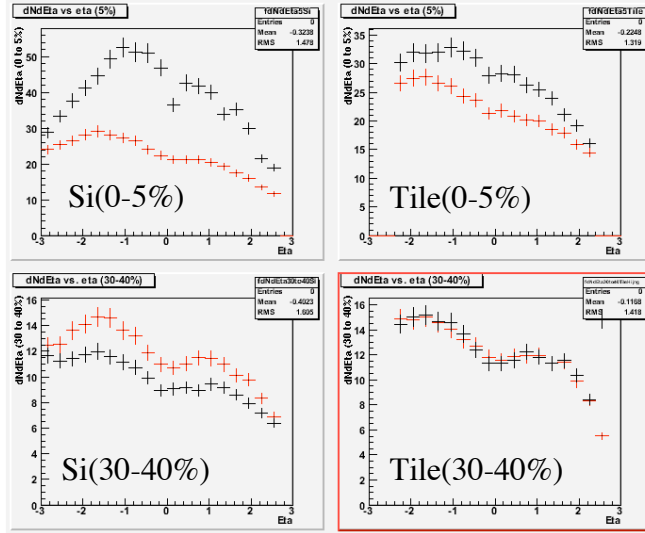

6/10/03

d+Au multiplicity

## However, there is reason to believe we need to be more careful with our Landau tails...

Black: GEANT simulation passed through analysis programs...

Red: Hijing input distributions...

6/10/03

d+Au multiplicity
