

Reaction Plane/Elliptic Flow Measurements in BRAHMS: Why and How

v_2 at RHIC is getting more interesting!

- high v_2 observed (viscosity, density),
- pt dependence: Hydro+pQCD,
- PID dependent: at $pt > 2$ GeV/c

$v_2(p, pbar) > v_2(\pi^+, \pi^-)$? (Hydro: $v_2(p, pbar) < v_2(\pi^+, \pi^-)$)

- Pseudo-rapidity dependent: v_2 drops too fast?
- Hydro (3d) cannot reproduce.

-Need more understanding of physics or measurement?

- **Need measurements of v_2 (PID,rapidity,pt,centrality)!**
- **BRAHMS is the only experiment can measure that!**

Flow Measurements in BRAHMS: How

- Determine reaction plane (r.p.) using charged particle azimuthal distribution – Look at identified particles in the spectrometers as a function of a reaction plane
- strongest signal at $y=0$ but non flow contribution (jets, resonances) is expected to be highest

v_2 for High p_t Particles

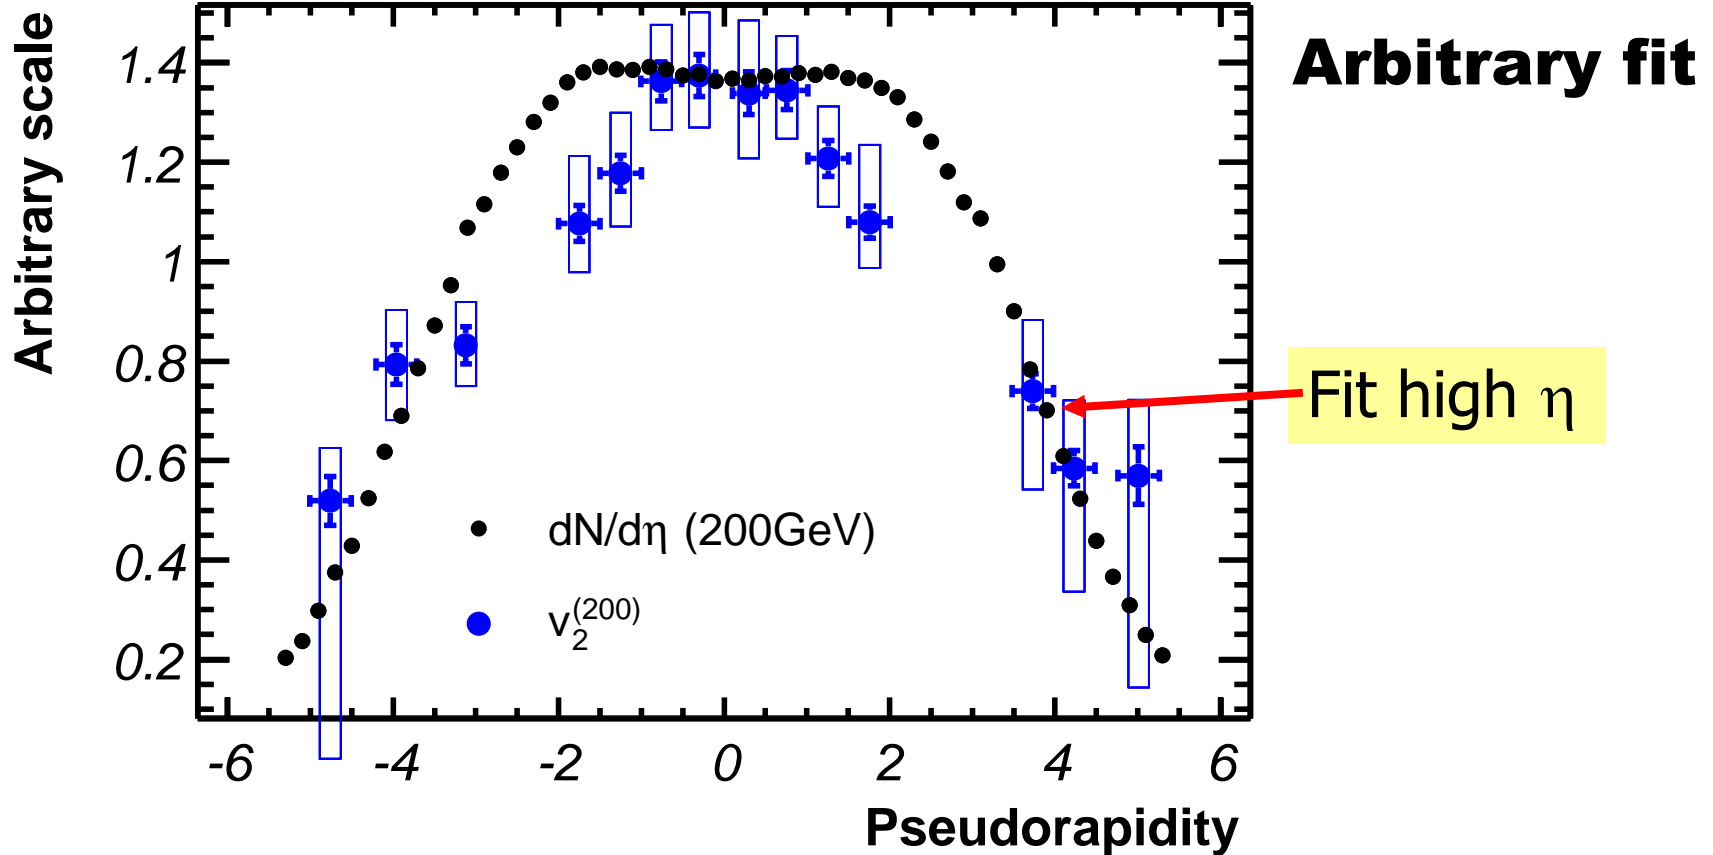

See also, M. Gyulassy, I. Vitev and X.N. Wang, nucl-th/00012092

v_2 is large ... but at $p_t > 2$ GeV/c the data starts to deviate from hydrodynamics

You may wonder anyway...

$dN/d\eta @ N_{\text{part}} \sim 200$

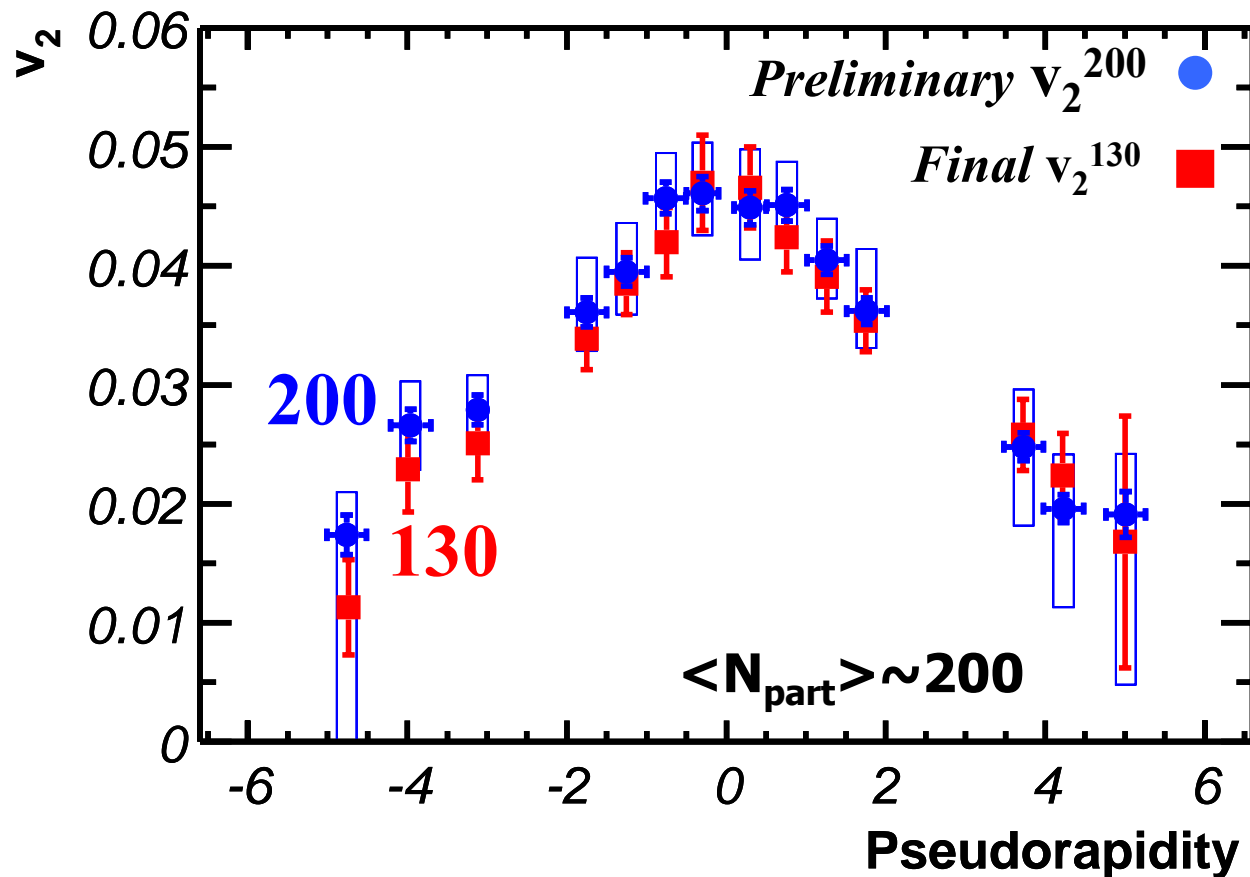

$dN/d\eta$ is broader than v_2

$v_2 \propto P_T \rightarrow$ Missing measurement $\langle P_T \rangle(\eta)$

How about η dependence?

Naïve expectation \rightarrow Boost invariance

PHENIX

Beam-beam counter
(BBC) $|\eta|=3\sim 4$
64pmts in each BBC
charged particles

two central arms
(CNT) $|\eta| < 0.35$
Dch, PCs, TOF, EMCAL
tracking, momentum, PID

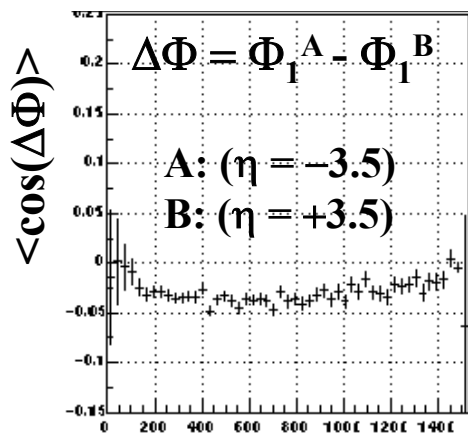

collision point

$\eta = -3.5$ vs $\eta = +3.5$
(directed : $n=1$)

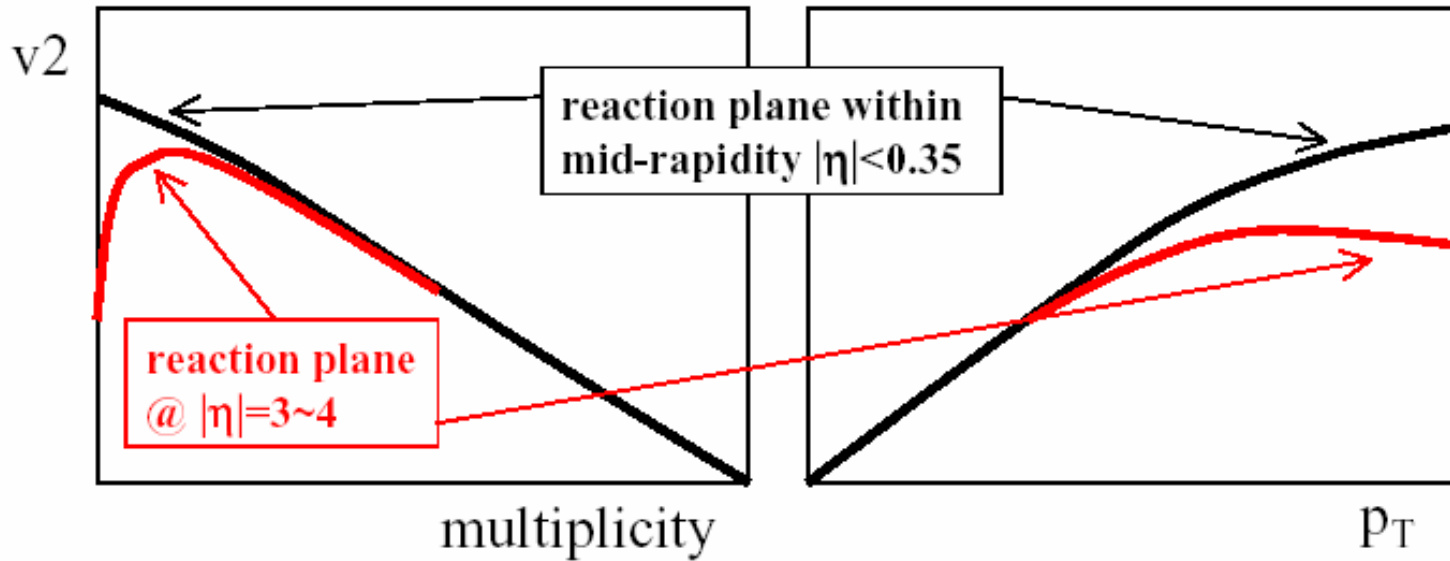

$\eta = -3.5$ vs $\eta = +3.5$
(elliptic : $n=2$)

$|\eta|=3.5$ vs $|\eta| < 0.35$
(elliptic : $n=2$)

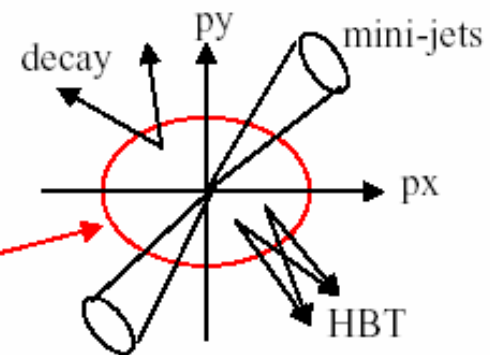

charged multiplicity \longrightarrow

mid-rapidity v_2

elliptic event anisotropy around the mid-rapidity \rightarrow Jet?! (non-flow)

“normal” elliptic flow with respect to the true reaction plane

We need detectors

- Need to measure v_2 in Run4
- Not much time to make new
- Reconfiguring Si
- Modified BB?
- (Damaged Silicon, Multiplicity/Centrality Issues, Background in Spectrometers)
- New detector at MRS? Any Ideas
- Adding pizza shape scintillator detectors with fibers?

- 16-24 segmentations
- Cover $\sim 1-1.5$ unit of h at $\sim 3-4$
($dN/dh \sim 200$ for 20-30% at $y \sim 3.5 \sim 10$ /slice)
- 2 sides preferred
- Tile worked. Light design.
- Shouldn't be much problem for BB
- Problem for FS? (lighter than trigger counter)
- Need simulations
- Can serve as extra centrality detector
